

M4 NETWORK EQUIPMENT MANAGER

Share critical, real-time data from network equipment with unparalleled visibility into the network.

Features

- Trace from A to Z through ISP, OSP, logical and customer connections
- Manage ISP assets, floor space and bays
- Design racks and network equipment
- Import equipment templates from a secure web library
- Access available port information on a mobile device in the field

Benefits

- Evaluate rack space utilization
- Easily attach images and documents to equipment
- Seamlessly connect fiber and copper directly to the port
- Instantly access fiber cut locations

Overview

Design, map and manage your entire inside plant for copper, coax and fiber based systems. M4 NEM provides the ability to convert retrievable and audited data into live, interactive rack elevations from information within the database.

“ *Tracking equipment in M4 makes it easier for the work order process using the Network Equipment Manager, which helps us work with Network and Engineering and also Customer Service with customer information.* ”
